

# Project Settings For Final Cut Pro

To edit your Project settings - choose File > New > Sequence.

This will create a sequence file in the top left window of FCP. Right click on this sequence file and choose 'settings'. Adjust settings to one of these options below:

1. If using a mini-DV camera ( records to miniDV tape), or interlaced video, use this setting.
2. If using a camera that records in a format that is non-interlaced / progressive, use this setting.

For either option, if you wish to record your movie in a widescreen aspect ratio, rather than 4:3 as shown below, use width 640 x height 360.
